

1. Let the wavefunction $\Psi(x, t)$ be a solution to the time-dependent Schrödinger equation when the potential energy is given by $V(x)$. What is the solution to the Schrödinger equation if we now consider a potential of $V(x) + V_0$ where V_0 is a real positive constant.

2. A particle is observed in a quantum state described by the wavefunction

$$\Psi(x, t) = A \exp \left(-a \left(\frac{mx^2}{\hbar} + it \right) \right),$$

where A and a are real positive constants.

(a) Normalize Ψ .

$$\begin{aligned} 1 &= \int_{-\infty}^{\infty} |\Psi|^2 \, dx \\ &= \int_{-\infty}^{\infty} \Psi^* \Psi \, dx \\ &= \int_{-\infty}^{\infty} A \exp \left(-a \left(\frac{mx^2}{\hbar} + it \right) \right) A \exp \left(-a \left(\frac{mx^2}{\hbar} - it \right) \right) \, dx \\ &= A^2 \int_{-\infty}^{\infty} \exp \left(-a \left(\frac{mx^2}{\hbar} + it + \frac{mx^2}{\hbar} - it \right) \right) \, dx \\ &= A^2 \int_{-\infty}^{\infty} \exp \left(-\frac{2am}{\hbar} x^2 \right) \, dx \\ &= A^2 \sqrt{\frac{\pi}{\frac{2am}{\hbar}}}. \end{aligned}$$

Solving for A we find

$$A = \left(\frac{2am}{\pi \hbar} \right)^{1/4}.$$

- (b) What is the potential $V(x)$ that this particle finds itself within? Ψ is, by definition, a solution to the Schrödinger equation. Thus,

$$i\hbar \frac{\partial \Psi}{\partial t} = -\frac{\hbar^2}{2m} \frac{\partial^2 \Psi}{\partial x^2} + V\Psi.$$

Arranging for the potential energy function V we get

$$V = \frac{1}{\Psi} \left(i\hbar \frac{\partial \Psi}{\partial t} + \frac{\hbar^2}{2m} \frac{\partial^2 \Psi}{\partial x^2} \right).$$

To make these partial derivatives less threatening, we can begin by writing Ψ in the form $\Psi = A\psi(x)\phi(t)$. The A component is simply A , as found by normalization. The exponential term in Ψ can be separated into an x -dependent and t -dependent component;

$$\exp\left(\frac{-amx^2}{\hbar} - ait\right) = \exp\left(-\frac{amx^2}{\hbar}\right) \exp(-ait),$$

which become ψ and ϕ respectively. We know

$$\phi(t) = \exp\left(-\frac{iEt}{\hbar}\right) = \exp(-ait),$$

thus $a = E/\hbar$. We can now write V in a more approachable way with ordinary derivatives:

$$V = \frac{1}{A\psi\phi} \left(i\hbar A\psi \frac{d\phi}{dt} + \frac{\hbar^2}{2m} A\phi \frac{d^2\psi}{dx^2} \right).$$

The ordinary derivatives are

$$\frac{d\phi}{dt} = \frac{d}{dt} [\exp(-ait)] = -ai \exp(-ait) = -ai\phi,$$

and

$$\frac{d^2\psi}{dx^2} = \frac{d\psi}{dx} \left[-\frac{2amx}{\hbar} \exp\left(-\frac{amx^2}{\hbar}\right) \right] = \frac{-2am}{\hbar} \left(1 - \frac{2am}{\hbar} x^2 \right) \psi.$$

Thus the potential energy function V is given by

$$\begin{aligned} V &= \frac{1}{A\psi\phi} \left(i\hbar A\psi \frac{d\phi}{dt} + \frac{\hbar^2}{2m} A\phi \frac{d^2\psi}{dx^2} \right) \\ &= \frac{1}{A\psi\phi} \left(-i\hbar A\psi \frac{E}{\hbar} i\phi + \frac{\hbar^2}{2m} A\phi \frac{-2Em}{\hbar^2} \left(1 - \frac{2Em}{\hbar^2} x^2 \right) \psi \right) \\ &= E - E \left(1 - \frac{2Em}{\hbar^2} x^2 \right) \\ &= \frac{2mE^2}{\hbar^2} x^2. \end{aligned}$$

(c) Determine the expectation values $\langle x \rangle$, $\langle x^2 \rangle$, $\langle p \rangle$, $\langle p^2 \rangle$.

i. The expectation value of x , $\langle x \rangle$, is given by

$$\langle x \rangle = \int_{-\infty}^{\infty} x |\Psi|^2 dx$$

which is an odd function evaluated over symmetric limits and therefore

$$\langle x \rangle = 0.$$

ii. The mean square position, $\langle x^2 \rangle$, is given by

$$\begin{aligned} \langle x^2 \rangle &= \int_{-\infty}^{\infty} x^2 |\Psi|^2 dx \\ &= A^2 \int_{-\infty}^{\infty} x^2 \exp\left(-\frac{2am}{\hbar} x^2\right) dx \\ &= \sqrt{\frac{2am}{\pi\hbar}} \frac{\sqrt{\pi}}{2 \left(\frac{2am}{\hbar}\right)^{3/2}} \\ &= \end{aligned}$$

(d) Determine the standard deviations for position, σ_x , and momentum, σ_p .

(e) Are your values for σ_x and σ_p consistent with the uncertainty principle?

3. An electron is trapped in a harmonic quadratic potential. Suppose the expectation value for its position is given by $\langle x \rangle = \frac{a}{2} \sin(\omega t)$. Here, a is a real constant with units of length and ω is an angular frequency. What, if anything, can be concluded about the electron's momentum?
